

**Argus™ FK76M**  
**Soft- or Metal-Seated Trunnion Mounted**  
**Ball Valve for Critical Services**

## Long-lasting, tight shut-off performance

Argus FK76M ball valves from Flowserve deliver long-lasting, tight shut-off performance in numerous applications within the oil and gas, petrochemical and chemical industries. These engineered valves are available in metal-seated and soft-seated configurations as well as standard and severe service designs. A modular design makes them easy to adapt to various safety, emissions and performance requirements.

### Benefits summary

- Reliable, tight shut-off
- Gas-tight sealing
- Long lasting
- Broad application flexibility

Argus FK76M two-piece, metal-seated,  
high-temperature ball valve

### Engineered to perform

Proven features provide long service life with outstanding fugitive emissions performance and low operating torques in even the toughest applications.

- Trunnion-mounted design
- Robust stem bearing system
- Spring-loaded seats with cavity relief
- Match-lapped balls and seats for bubble-tight performance
- A true full bore
- A fully guided, anti-blow out stem

### Standard and severe service designs

Argus FK76M ball valves are easily adapted to a variety of standard and severe service applications. Configurable elements include:

- Soft or metal seats
- Uni-directional or bi-directional sealing
- Cast or forged construction
- Block and bleed design
- Optional trim materials
- Optional scraper design ball seats

**Note:** For high-speed, high-cycle polymer processing applications, the Argus FK76M PDS ball valve helps to extend maintenance intervals. Refer to brochure ARENBR0016.

## Applications

Argus FK76M ball valves are well-suited for a variety of applications in the **oil and gas, petrochemical and chemical industries** where reliable tight shut-off and uncompromising sealing are required.

Example applications include, but are not limited to:

- Emergency shutdown valves (ESDV)
- High-integrity pressure protection system (HIPPS)
- Coal conversion and gasification
- Polyethylene or polypropylene
- High-pressure oxygen, nitrogen or hydrogen
- High-temperature services
- High-cycle and switching services
- Solids handling (powders, fines, dust and catalysts)
- Thermal fluids
- On/off isolation service
- Oil and gas manifolds
- Separator, filter and drying systems
- Compressor stations

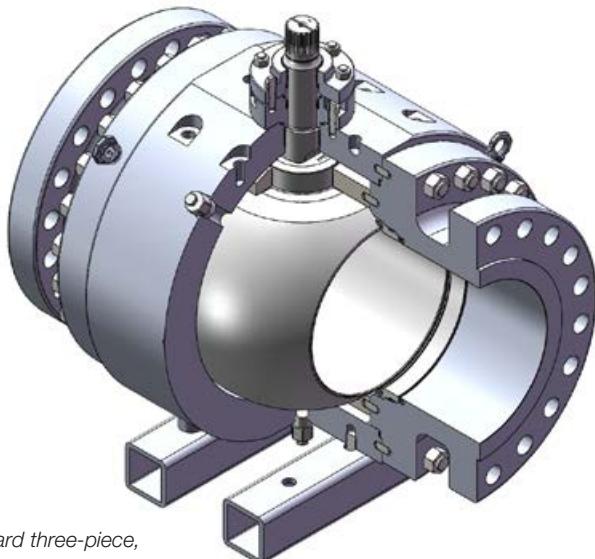

Argus FK76M two-piece,  
soft-seated ball valve

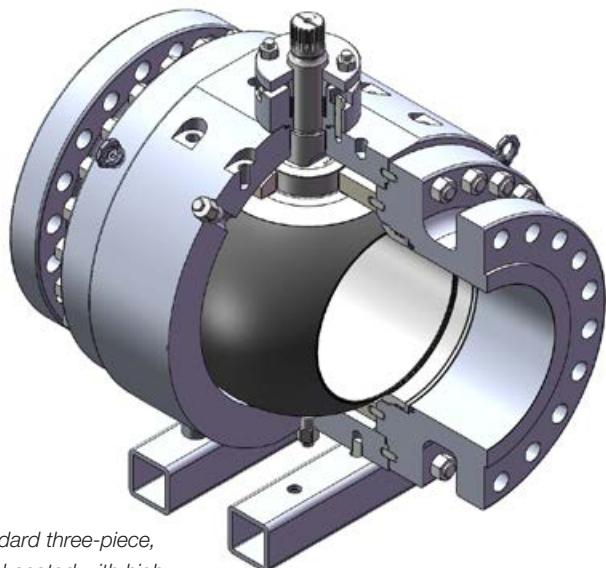

## Design standards

<b>Sizes</b>	3 to 24 in standard; 26 to 36 in available upon request
<b>Pressure rating</b>	PN 10 to 160; Class 150 to 900
<b>Design</b>	API 6D, ASME B16.34 (on request)
<b>Design calculation</b>	DIN EN 12516
<b>Pressure/temperature rating</b>	ASME B16.34 or DIN EN 1092
<b>Shell wall thickness</b>	ASME B16.34 or DIN EN 12516-1
<b>Bore dimensions</b>	API 6D or DIN EN 1983, DIN EN 17292 or DIN EN 13942
<b>Face-to-face dimensions</b>	ASME B16.10 or DIN 558
<b>Flange end dimensions</b>	ASME B16.5 or DIN EN 1092
<b>NACE</b>	MR 0103 or MR 0175 (on request)
<b>Fugitive emissions</b>	ISO 15848 (AH-CO3), VDI 2440
<b>Fire-safe type test</b>	API 607 or ISO 10497-5
<b>Valve material qualification</b>	ASME, PED, material according to AD 2000

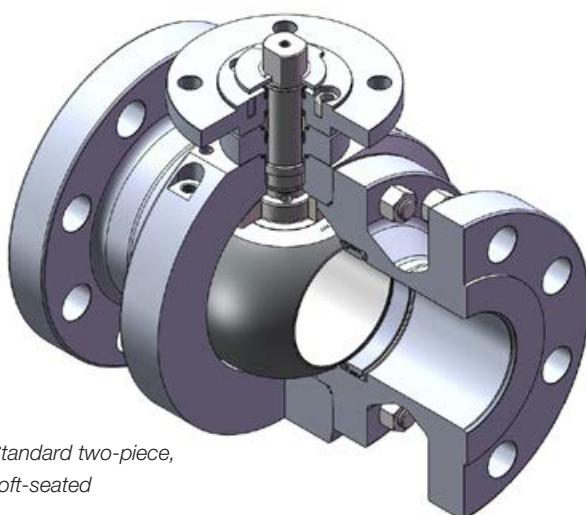

## Configurations

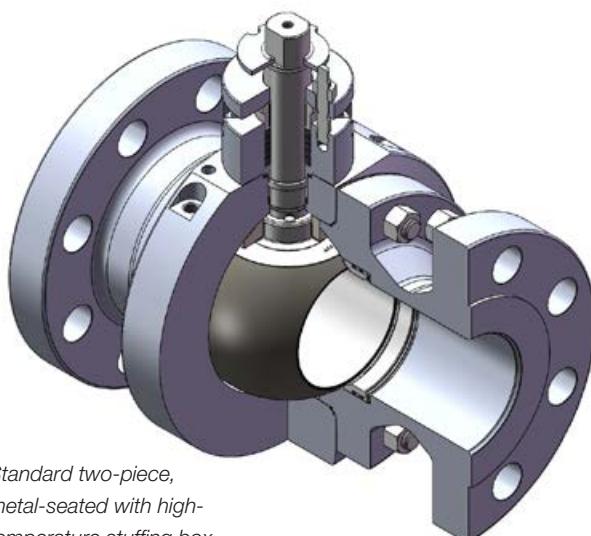

Standard three-piece,  
soft-seated

Standard three-piece,

<b>900</b>	x	x	x	x	x	x	x	x	x

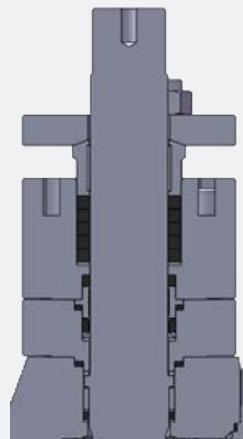

## Stem sealing

Managing fugitive emissions is a major challenge within the chemical and petrochemical industries. Argus FK76M stem sealing systems are certified per ISO 15848 (AH-CO).

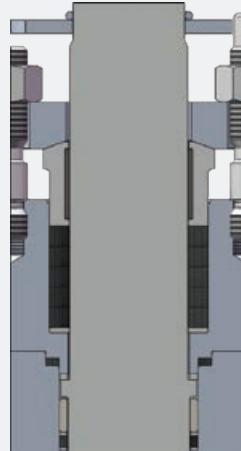

Besides reducing fugitive emissions, the upsides are improved plant efficiency and reduced energy costs.

TA-Luft/ISO 15848/EPA

ISB integrated stuffing box; ISO 15848-EPA

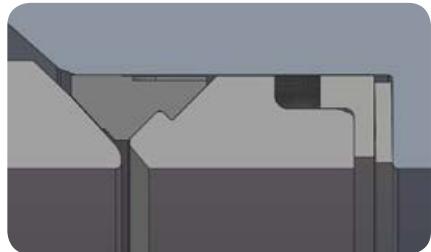

High-temperature stuffing box

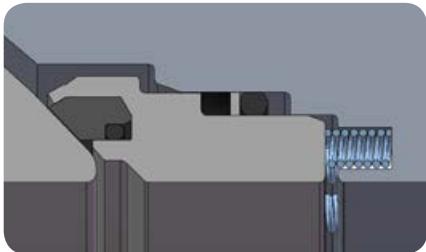

## Ball seat designs

Argus FK76M valves are available with several ball seal designs to best suit the process conditions. A metal-to-metal seat design or a chambered soft seat design with various secondary seals cover the highest standards related to seat tightness in the media flow.

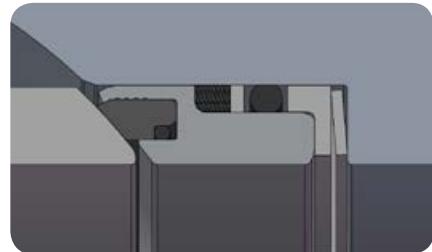

### Soft seats

*PTFE seat with graphite secondary seal and Belleville washer (other materials on request)*

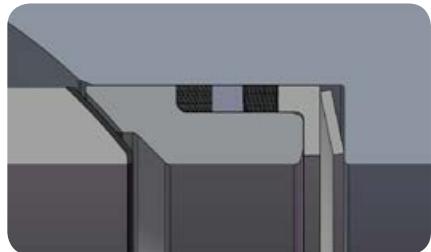

*PEEK® O-ring with graphite coil springs, NPS >12 (Belleville washer design on request)*

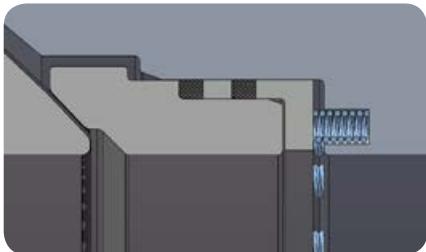

*PEEK O-ring with graphite coil springs and Belleville washer*

### Metal seats

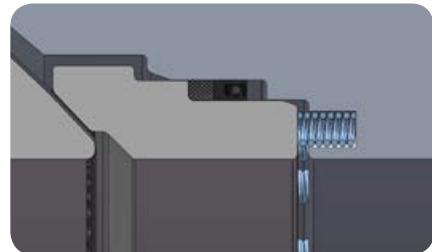

- Coil spring or Belleville washer loaded seats, depending on the size and pressure range, for balanced continuous contact with the ball
- Bi-directional sealing, double-seat design

*Metal seated lip seal with graphite secondary seal and Belleville washer, NPS 3-12 (other designs on request)*

*Metal seated graphite coil springs, NPS >12 (Belleville washer design on request)*

*Metal seated lip seal with graphite coil springs, NPS >12 (Belleville washer design on request)*

### Trunnion mounted

- Ease of actuation and often downsized actuator sizing due to reduced break and operating torque
- Improved valve performance and extended cycle time enabled by low-friction bearings
- Allows bi-directional upstream and downstream sealing also under reverse pressure applications
- API 6D design allows ball valve tightness testing via drain or vent plugs (optional)

### Full bore

- Straight true full bore offers low flow resistance at high  $C_v$  per nominal size.

## Pressure-temperature curve

### Soft versus metal seats

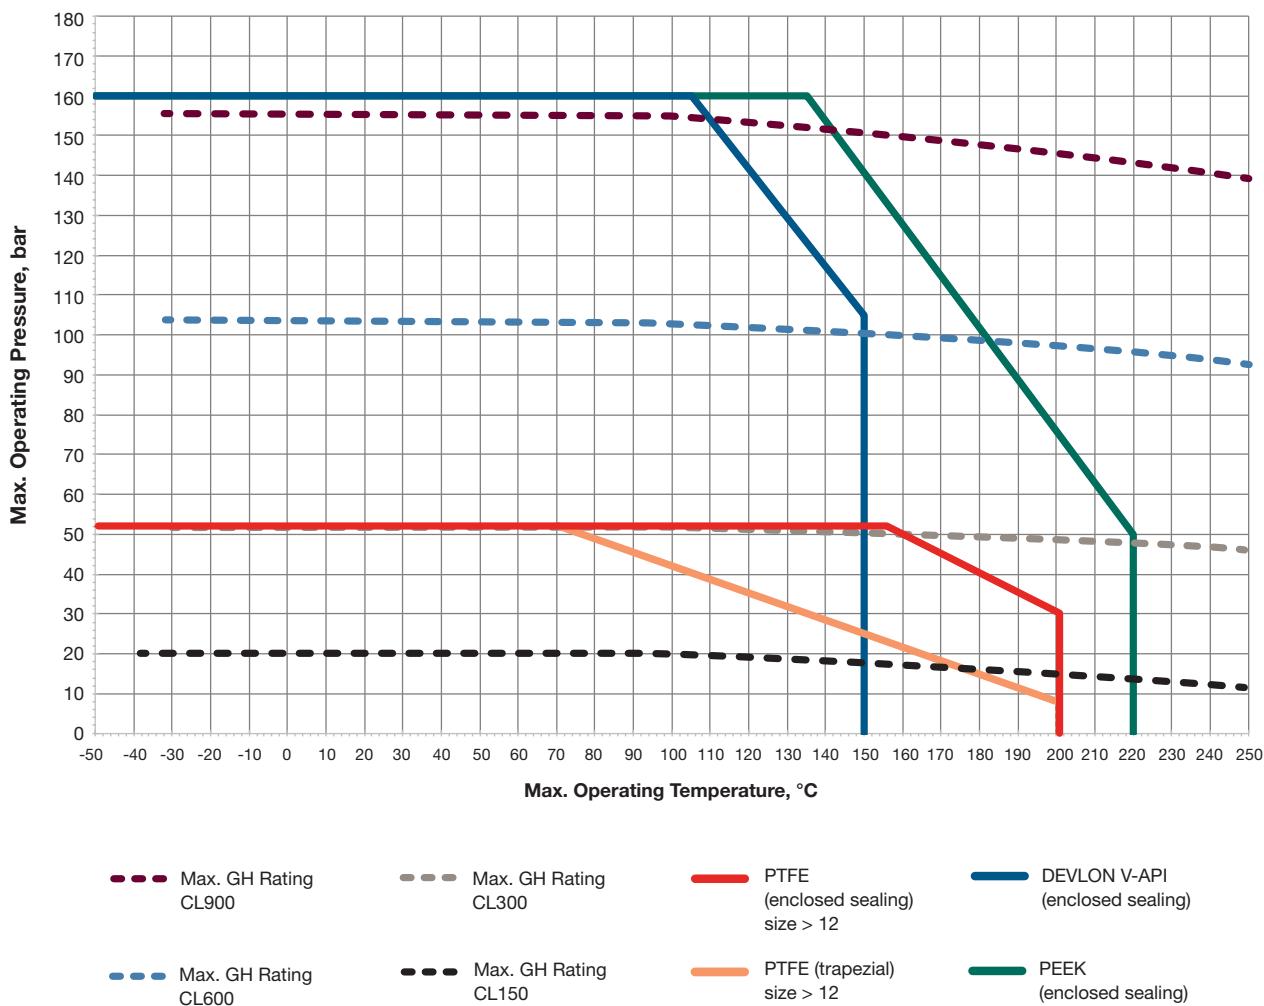

Seat sealing materials for Argus FK76M valves may be PTFE, POM, Devlon, PEEK or steel. The pressure-temperature ratings of soft seated ball valves are determined not only by the valve body materials, but also by the sealing material used for the ball seats. Pressure-temperature seat ratings for metal seated valves are the same as the body ratings.

### About this chart

It is very difficult to determine the exact pressure-temperature ratings for all media under all imaginable conditions. As such, we have prepared a general pressure-temperature chart based upon our experience in both field and laboratory conditions.

Pressure-temperature ratings for soft seated valves (indicated by the solid lines in the chart below) are based on differential pressure with the ball in a fully closed position and refer to the seats only. The dotted lines indicate the maximum working pressure for carbon steel valve bodies, made from TSTE 355 N (equivalent to ASTM A350 Grade LF2).

### FK76M P/T – Rating

# Properties of seat sealing materials and coatings

## Materials for standard construction

### PTFE

With few exceptions, PTFE is corrosion-resistant to acids, leaches, solvents, aliphatic and aromatic as well as chlorinated hydrocarbons and many other liquids. It is suitable for a wide range of temperatures: -200°C to 200°C (-328°F to 392°F) as standard; to 250°C (482°F) in special applications.

### POM

Particularly suitable for high pressures to 800 bar (11,603 psi) at temperatures ranging from -18°C to 100°C (0.4°F to 212°F); -60°C to 121°C (-76°F to 250°F) in special applications.

### DEVLON

Users of Argus FK76M valves will experience a multitude of benefits. Argus FK76M valves have superior pressure/temperature operating ranges in comparison to PTFE or Nylon 6. The valves have been proven in operation to a pressure of 414 bar (6000 psi), subject to valve and seat design. In addition, they have been proven in operation from -50°C to 176°C (-58°F to 350°F), subject to valve and seat design. Their low moisture absorption level enhances dimensional stability. They have superior dimensional stability over PTFE in high-pressure applications. They have lower frictional losses than PEEK products, possess exceptional resistance to wear and abrasion, and sufficiently conform to seals in low-pressure valve applications. Moreover, they have excellent life performance in soft valve seat applications.

### PEEK (Lyton)

A linear polymer with lubricant, this material has excellent resistance at high pressures with temperatures to 250°C (482°F). PEEK is resistant to solvents, alcohol, oil, grease, fuels leaches, acids (limited) and water.

## Coatings

### HVOF

Crabide or WC

Crabide is a hard metal alloy based on chromium carbide and nickel-chromium or tungsten carbide. The coating applied by high-speed flame spraying is characterized by high hardness, density and adhesive strength. The coating is independent of the base material; all metallic materials used in industry can be coated. There is no metallurgical influence on the base material during the coating process. The adhesive strength of the spray coating results from the mechanical bonding with the base material.

### Spray fusion

The Arguloy hard layer on the ball surface and the seats is a nickel-based alloy which is welded on the base metal and fused by a special heat treatment. They layers are homogeneous, free of cracks, and are corrosion and wear resistant. Hardness of the layers exceeds the hardness of Stellite.

In our innovative coating center, we use the most modern computer-controlled machinery and engineering methods with an extensive quality program. Argus valves are able to produce metal seats and the balls with spherical accuracies and superfine surfaces with a roughness of 1 micron for server gaseous applications.

## Seat sealing systems

Effective sealing of Argus FK76M ball valves depends on several factors:

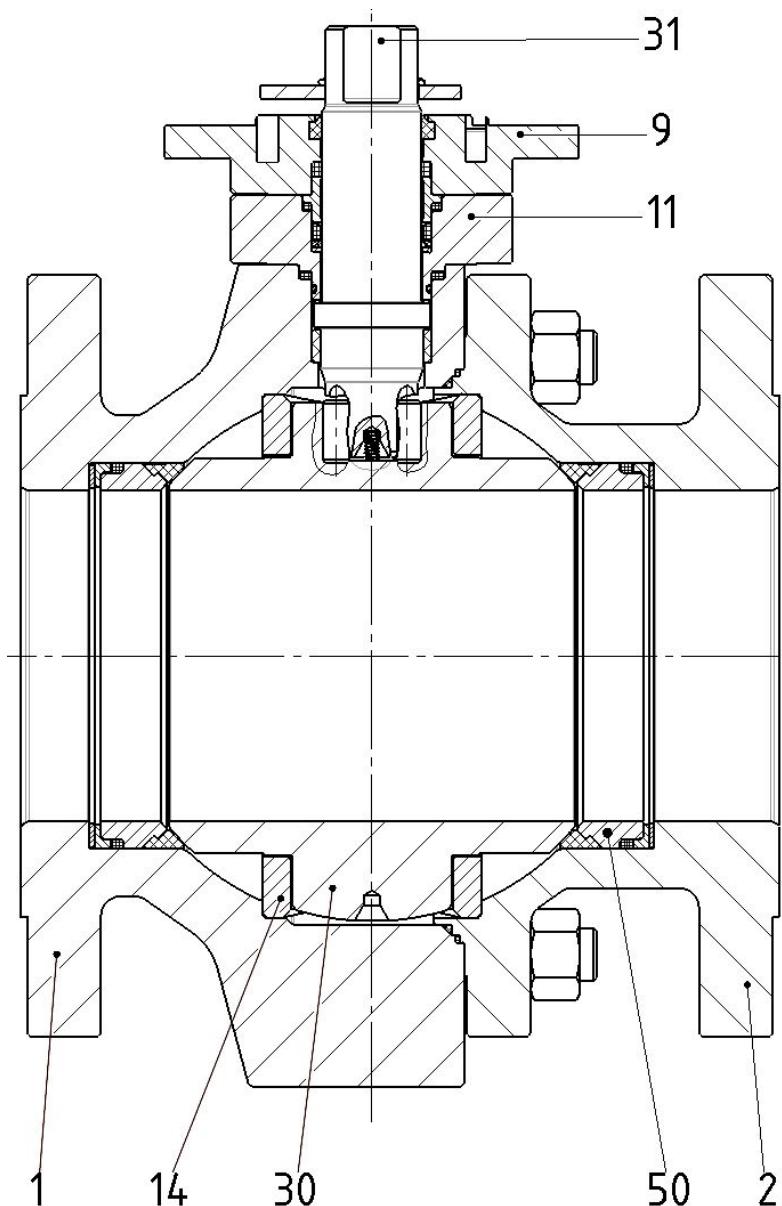

- Contact pressure
- Contact surface of the seat
- Accuracy of surface finish on the ball and on the ball seat
- Sealing design and the sealing material

The contact pressure is built up by the initial stress in the seat (compact or spring supported) and the medium pressure.

The extremely high durability of the Argus sealing system is achieved via close manufacturing tolerances, which are guaranteed by the Flowserve QA system and by rule-based innovative engineering design work.

## High-cycle designs

### Standard

- Metallic seat: >15k; max. 200k cycles/year
- Soft seat: >15k; max. 150k cycles/year
- Standard cycle time: >1 sec/in

### Moderate

- Metallic seat: >200k; max. 1000k cycles/year
- Soft seat: >150k; max. 800k cycles/year
- Fast cycle time: ≤ 1 sec/in

### Ultimate

- Metallic seat: >1000k; max. 2000k cycles/year
- Soft seat: N/A
- Fast cycle time: ≤ 1 sec/in

# Thermal coatings for metal-seated ball valves

## Coatings: HVOF

### Advantages

- Applicable on any metallic base material
- Highest hardness and wear resistance

### Disadvantages

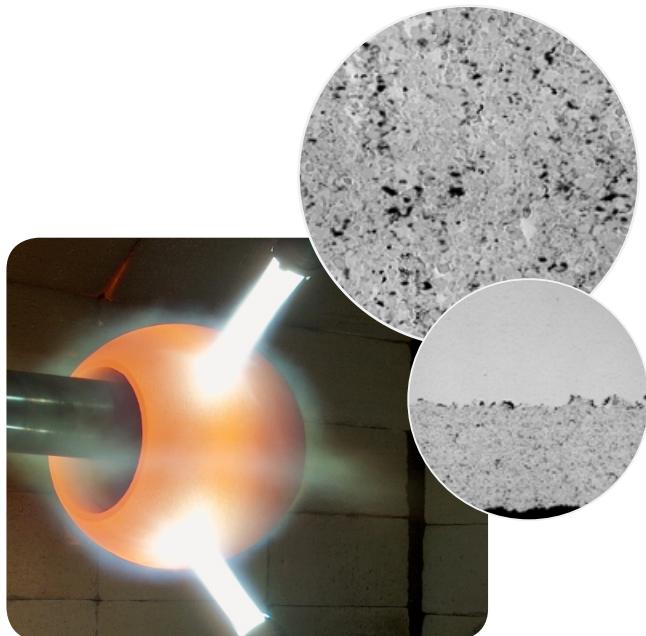

- Mechanical bond
- Some porosity
- Cracking and spalling happen very rarely

### Applications

- General service, moderate operating cycles
- High pressure
- High temperature

### Materials

- Carbide (Cr<sub>3</sub>C<sub>2</sub>-NiCr): 900–1100 HV 0.3 to 900°C (1652°F)
- WC-Co: 1000–1400 HV 0.3 to 500°C (932°F)
- WC-CoCr: 1000–1400 HV 0.3 to 500°C (932°F)

## Flame spraying and fusing: Arguloy

### Advantages

- Closed porosity
- Metallurgical bond

### Disadvantages

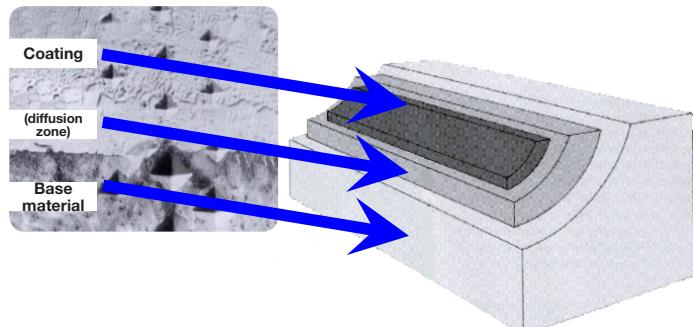

- Restrictions in base materials

### Applications

- Severe service
- High pressure
- Oxygen
- Low leakage classes
- Thermal cycling or shock
- High and ultimate operating cycles

### Materials

- Arguloy 1 (NiCrBSi): 50–750 HV 0.3 and 58–62 HRC to 750°C (1382°F)
- Arguloy 2 (NiCrBSi+WC): 750–850 HV 0.3 and 62–65 HRC to 750°C (1382°F)
- Arguloy 3 (Co-Based): 680–750 HV 0.3 and 59–62 HRC to 800°C (1472°F)

## Test procedures

ANSI/FCI 70-2	Rate V	Type B	Water	1.0 PN	Pathway	
ANSI/FCI 70-2	Rate V	Type B1	Air—N2	3.5 bar	Pathway	
ANSI/FCI 70-2	Rate VI	Type C	Air—N2	3.5 bar	Pathway	
ISO 5208	Rate D water		Water	1.1 PN	Pathway	(DBB Caverne)
ISO 5208	Rate D gas		Air—N2	1.1 PN or 6 bar	Pathway	(DBB Caverne)
API 598	Test water		Water	1.1 PN	Pathway	(DBB Caverne)
API 598	Test gas		Air—N2	1.1 PN or 5.5 bar	Pathway	(DBB Caverne)

## In-house testing procedures

Each valve is tested for body integrity and seat tightness at a body test pressure of 1.5xPN. The test pressure for metal-seated valves is 1.1xPN versus 6 bar for soft-seated designs. Standard test medium is water; air may be used on request.

## Test standards

Standard testing is per FCI 70-2 Class V or VI for soft and metal-seated valves. Testing per API 598 also available.

## Flow rates ( $C_v$ and $K_v$ ) – full bore

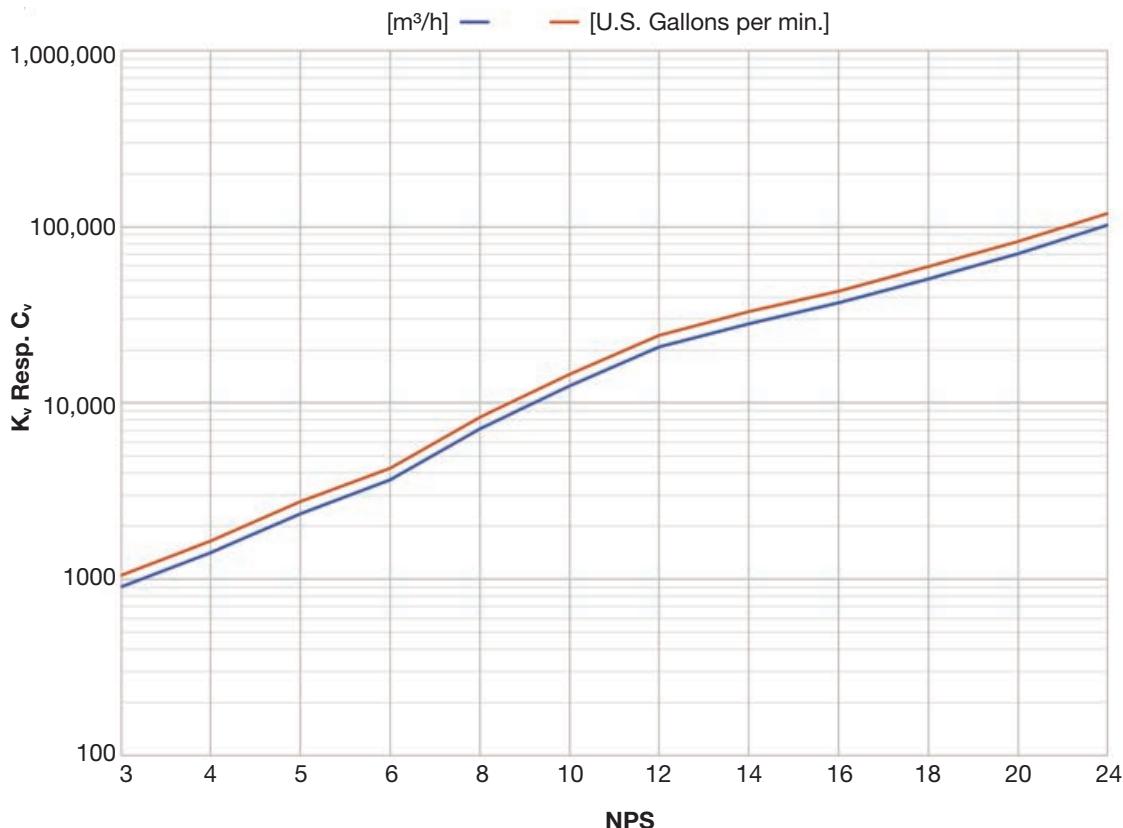

**Flow Rate per NAN7154 (2014) – Full Bore**

DN (mm)	NPS (in)	Clear Width (mm)	$K_v^{*1}$ (m³/h)	$C_v^{*2}$ (U.S. gpm)
80	3	78	905	1056
100	4	100	1414	1650
125	5	125	2362	2758
150	6	150	3674	4288
200	8	200	7155	8350
250	10	250	12,500	14,590
300	12	300	20,780	24,250
350	14	350	28,290	33,014
400	16	400	37,000	43,100
450	18	450	50,800	59,283
500	20	500	70,700	82,500
600	24	600	10,200	119,000

\*1  $K_v$  value is the full capacity flow rate through the ball valve in cubic meters per hour of water at 5°C to 30°C (41°F to 86°F) with a pressure drop of 1 bar.

\*2  $C_v$  value is the full capacity flow rate through the ball valve in U.S. gallons per minute of water at 5°C to 30°C (41°F to 86°F) with a pressure drop of 1 psi.

**Flow Rate per NAN7154 (2014) – Full Bore**

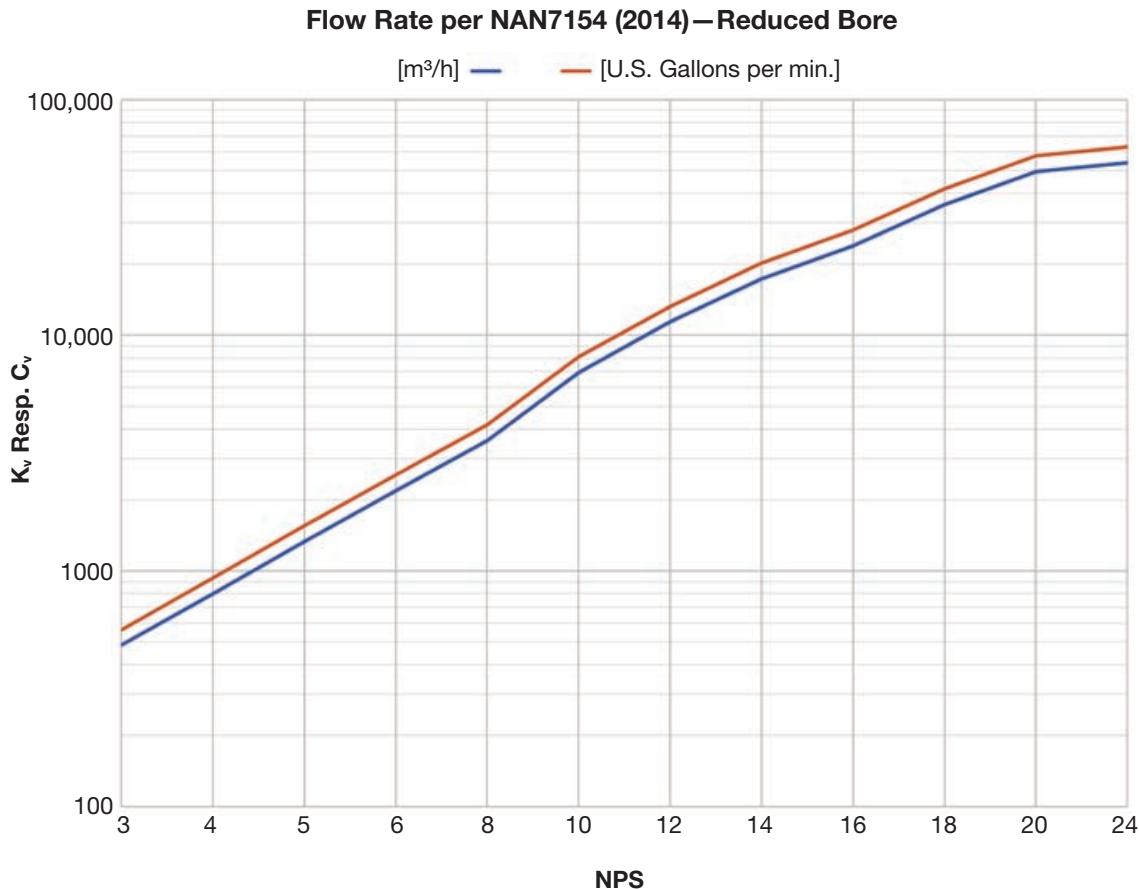

## Flow rates ( $C_v$ and $K_v$ ) – reduced bore

## Proactive maintenance recommendations

### Metal-seated ball valves

1. Use only OEM spare parts.
2. Perform first maintenance no more than *two years* after operational startup of plant.
3. Replace all soft parts, including all O-rings, sealing rings and bearings.
4. Examine metal trim kit (ball and ball seats) to ensure all components are still in good shape.

**NOTE:** The metal trim kit is a wearing part; however, under normal operating conditions, it should last at least 200,000 cycles (approximately three years).

5. Examine stem and stem journal to ensure all components are still in good shape.
6. It is strongly recommended that this maintenance be repeated every two to three years, even though the metal trim kit can last much longer. Failure of a soft part, e.g., a bearing, the metal trim kit or valve body could be severely damaged.

### Soft-seated ball valves

1. Use only OEM spare parts.
2. Perform first maintenance no more than *one year* after operational startup of plant.
3. Replace all soft parts, including all O-rings, sealing rings, bearings and PEEK (Lyton) ball seats.
4. Examine ball, stem and stem journal to ensure all components are still in good shape.
5. It is strongly recommended that this maintenance be repeated every two years.

### Automated valves in severe services

Severe service conditions—such as high cycling, high temperatures, abrasive or erosive media, or solids-containing fluids—may influence the service life and performance of the valve. In the case of automated valves, it is recommended that proactive and regular maintenance of the bracket and actuator bolting also be performed.

**ARENBR0015 (EN/AQ)** September 2019

Flowserve Corporation has established industry leadership in the design and manufacture of its products. When properly selected, this Flowserve product is designed to perform its intended function safely during its useful life. However, the purchaser or user of Flowserve products should be aware that Flowserve products might be used in numerous applications under a wide variety of industrial service conditions. Although Flowserve can provide general guidelines, it cannot provide specific data and warnings for all possible applications. The purchaser/user must therefore assume the ultimate responsibility for the proper sizing and selection, installation, operation, and maintenance of Flowserve products. The purchaser/user should read and understand the Installation Instructions included with the product, and train its employees and contractors in the safe use of Flowserve products in connection with the specific application.

While the information and specifications contained in this literature are believed to be accurate, they are supplied for informative purposes only and should not be considered certified or as a guarantee of satisfactory results by reliance thereon. Nothing contained herein is to be construed as a warranty or guarantee, express or implied, regarding any matter with respect to this product. Because Flowserve is continually improving and upgrading its product design, the specifications, dimensions and information contained herein are subject to change without notice. Should any question arise concerning these provisions, the purchaser/user should contact Flowserve Corporation at any one of its worldwide operations or offices.
