

COMPACT PNEUMATIC ACTUATOR 4x4

VAHN-TECH International Inc., headquartered in Toronto, Canada is a unique company within the Flow Control Industry.

- * 'vt' brand = high quality certified products (API, NSF, CSA, WRAS etc.)
- * Valves, Actuators and Accessories – all 'vt' branded
- * Width and Depth of Product Offerings
- * Flexibility to customize products to customer needs
- * Specialized user-friendly products including large sizes
- * Quick Response
- * Reduced Delivery times
- * Efficient after sales service
- * Competitive Pricing

VAHN-TECH International Inc. is a customer focused organization based on “Value-add” and “Quality Service” principles. Achieving long term partnership with our customers and being their supplier of choice is our prime mission.

We develop, manufacture and market VAHN-TECH (vt) branded Valves, Actuators, Automatic Control Valves and Accessories for variety of Industrial Applications. Our product range includes:

Oil and Gas

Water and Sewage,
Desalination

Chemicals

Paper and Pulp

Irrigation

Power Plants

Various
Industrial Applications

We can supply all types of valves with following materials of construction like:

Ductile Iron, Cast Iron, Carbon Steel, Stainless Steel – SS304, SS304L, SS316, SS316L, Duplex Stainless Steel, Super Duplex, Alloy, Monel and Inconel with variety of seating and stem configurations.

KEY ADVANTAGES OF THE COMPACT ACTUATOR

Compact Design - Helps in Efficient Design of Package Units

The Vahn-Tech Pneumatic Actuator Series 4x4 packs more than double the torque of conventional rack and pinion actuators thanks to its four pistons generating torque around a centrally located pinion. With more pistons in the actuator, this allows the actuator being more compact with size reduced by more than 30% compared to double piston actuator of the same torque.

Faster and Better

With four small cylinders each located on one of four sides of the unit and at a given air pressure, the 4x4 produces the same torque output as double piston models using smaller diameter pistons and a narrower pinion. The narrower pinion allows the pistons to travel shorter distances so that they can move faster from one position to the next.

Reduced Air Consumption

The cube shape coupled with pistons traveling shorter distances minimizes size requirements while maximizing torque output. At the same time, shorter piston travel and compact size greatly reduces pressure requirements compared to other designs and results in reduced energy expenditure with up to 2.5 times saving on air consumption compared to double piston design.

Spring Combination

Because of the four-cylinder design, the 4x4 has many more spring combination possibilities than double piston actuators. This means better solutions under any air pressure requirement. Each chamber can use up to three different spring sizes which nest between the covers and pistons and align by centering rings. Also, springs are wound in opposite directions to avoid complications during operation.

Excellent Weather and Corrosion Resistance

For superior corrosion resistance, the body and covers are anodized internally and externally. Plus, they have an external epoxy base layer and a second polyurethane paint to further reduce corrosion in demanding applications. Extended spray wash downs do not create corrosion problems for the actuator. In addition, the short stretch distance of the piston highly raises the working time of the sealing elements inside the actuator.

DESIGN FEATURES

Travel stops can be adjusted by four studs at the base of the actuator. The studs are opposed from each other so no unequal forces are generated, the stop design allows for $\pm 5^\circ$ adjustment in both opening and closing rotations. Mid-stroke stop points can be achieved with longer studs.

Blowout proof Acetal support pad in body maintains proper contact of the piston racks to the pinion at all times.

Nested springs are aligned by rings cut in the piston face and end cap. This ensures correct orientation. With four cylinder areas, many different combinations are available allowing for correct sizing.

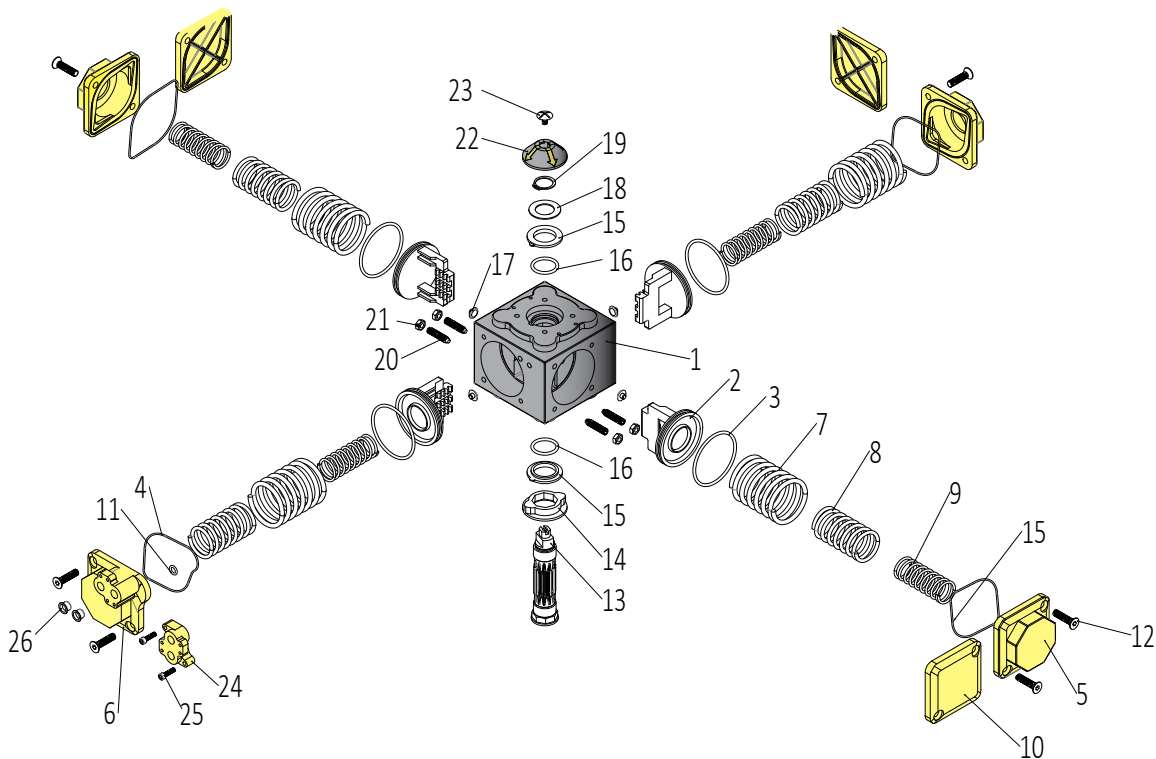

GENERAL FEATURES

- ✦ Vahn-Tech Compact Pneumatic Actuator 4x4 utilizes carbon steel pistons that allow for higher cycles because of their greater strength.
- ✦ Viton seals in the piston drive shaft also lead to higher cycles. Inside surface finish (Ra 0.4 - 0.6um) to minimize friction and to maximize the life of the actuator.
- ✦ Standard applications for temperature range from;

BUNA	-4°F to 176°F
	-20°C to 80°C
Alternative Options:	
Viton	-4°F to 250°F
	-20°C to 120°C
EPDM	-40°F to 176°F
	-40°C to 80°C
- ✦ Piston bearing made of material with low friction coefficient to avoid metal to metal contact. Easily replaceable for maintenance.
- ✦ Double lower drilling for valve mounting, and centering, according to ISO 5211/DIN 3337 standards.
- ✦ Independent bi-directional travel stop adjustment +/- 5° ensuring precise positioning in all flow control services, adjustable between 85° - 95° rotation.
- ✦ Direct mounted solenoid connections according to NAMUR standards. Lower female shaft key, according to ISO 5211/DIN 3337 standards, for assembly on with star or square shaft.
- ✦ Air supply: can be dry or lubricated filtered compressed air.
- ✦ High quality lubricants allow for a minimum of 1,000,000 operations.
- ✦ Epoxy powder coating is performed on clean and sandblasted components. The coating process and subsequent heat treatment are kept under tight control of to ensure higher protection of the actuator against corrosion. Epoxy coating is mandatory for use in aggressive environment. With a normal thickness of 200/250 microns, resistance to salty fog exceeds 1,000 hours. Epoxy coating also resists most acids and alkali and shows high resistance to UV. In order to retain its property, the coating must not be scratched.
- ✦ Visual position indicator the 4x4 actuators are supplied as standard.
- ✦ The indicator designed to remain on the actuator for continuous indication when limit switch is being used.
 - * (Not applicable in size X40)

PARTS AND IDENTIFICATION

Part No.	Qty.	Parts Description	Standard Material
1	1	Body	Alumimun AL101A-T6
2	4	Piston	Carbon Steel S45C Nickel Plated
3	4	Piston O-Ring	BUNA / Viton / EPDM
4	4	Cover O-Ring	BUNA / Viton / EPDM

8	Max 4	Middle Spring	Painted Spring Steel
9	Max 4	Outer Spring	Painted Spring Steel
10	3	Double Acting Cover	Alumimun AL101A / 101
11	1	Air Supply O-Rin	BUNA / Viton / EPDM
12	8	Cover Screw	Stainless Steel 304
13	1	Pinion	Steel
14	1	Stroke Adjustment Stop	Stainless Steel 304
15	2	Thrust Washer	Acetal / NOVA
16	2	Pinion O-Ring	Viton / EPDM
17	4	Pad	Acetal
18	1	Disc Bearing	Stainless Steel 304
19	1	Snap Ring	High Alloy Spring Steel
20	4	Stroke Adjustment Stud	Stainless Steel 304
21	4	Nut	Stainless Steel 304
22	1	Indicator	ABS
23	1	Indicator Bolt	ABS
24	1	Namur Insert (Size 90 / 115)	Alumimun AL101A / 101
25	2	Bolt (Size 90 / 115)	Stainless Steel 304
26	2	Plug	Plastic

OPERATIONS

Double Acting actuator

Air supplied to Port A which is connected to the center chambers forces piston apart toward end position with exhaust air exiting at Port B (a counterclockwise rotation is obtained).

Air supplied to Port B which is connected to the four chambers forces piston toward center with exhaust air exiting at Port A (a clockwise rotation is obtained).

Spring Return Actuator

Air supplied to Port A which is connected to the center chamber forces piston apart and toward end position compressing springs, with exhaust air exiting at Port B (a counterclockwise rotation is obtained).

Release of air allows springs to force pistons toward center position with exhaust air exiting at Port A (a clockwise rotation is obtained).

ACTUATION SIZING GUIDE

The seat material used, media, temperature, frequency of operation and critical application of the valve's operation are all important factors in calculating the actuation needs of a given valve. The information provided below should be considered as a guide only and must be adjusted according to experience and actual design. Proper actuator selection is required to prevent valve or process equipment damage as well as proper valve operation.

Valve Torque

The torque requirements of valves will vary depending on several factors, e.g for Ball Valves:

Seat Design and Material

The seat friction force depends on the seat material and the applicable service factor multipliers shown in the chart below.

Stem Seal

Torque results from the stem contact with stem seals and the type of packing materials affect torque. Stem seal torque needs to be considered as a percentage of overall torque especially in small valve sizes.

Service Conditions To Consider

Differential Pressure	Minimum and maximum pressures
Frequency of Operation	Stuck valve torque
Media Influence Slurries	dry gases, oils
Temperatures	Minimum and maximums
Cycle Time	Line hammer, process requirements
Instrument Air Supply	Peak demand pressure availability

Media and Service Factors

To establish minimum torque requirements, multiply valve torque by the following application media and service factors.

Media Factor	Multiplier
Clean Particle Free, Non-Lubricating (Water, Alcohol or Solvents)	1.00
Clean Particle Free, Lubricating Oil	0.80
Slurries or heavily corroded and contaminated system	1.30 to 2.00
Gas or Saturated Steam, clean and wet	1.00
Gas or Superheated Steam, clean and dry	1.30
Gas, Dirty Unfiltered e.g natural gas, chlorine	1.20 to 1.50

Media Factor	Multiplier
Simple On and Off Operations	1.00
Throttling	1.20
Positioner Control	1.50
Once per day session	1.20
Once every two days or more or plant critical	1.50

Double Acting Actuator (DA)

In the double acting actuators, the control pinion rotation and its reversal are obtained by reversing the supply to the two input ports. The output torques obtainable mainly depends on the cylinder diameter and the supply pressure, by increasing one or both factors, the available torque also increases. As shown in diagram A, the torque of a DA actuator is constant throughout the entire rotation and relevant reversal. The normal advised safety factor, in addition to the stated valve manufacturer torque, is 20%.

Diagram A

*Select the actuator size whose torque output at given pressure exceeds the valve torque and application factor.

Spring Return Actuator (SR)

In the Spring Return actuators, which utilize springs for reversing the rotation of the control pinion, the output torque depends not only on the cylinder diameter and the supply pressure, but also on the presence of the springs, which should be compressed to guarantee the return. As shown in diagram B, the available torque at 0° progressively reduces during the rotation due to the springs' compression. On the contrary, as shown in diagram C, the torque starting from the 90° position constantly decreases until 0° because of spring extension. Owing to the higher friction present, the safety coefficient in this case is advised 25%.

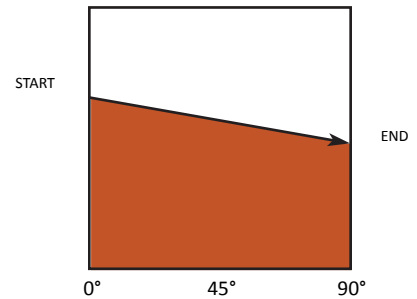

Diagram B

Diagram C

*Select the actuator whose torque output at 0° and 90° at a given air pressure exceeds the valve torque.

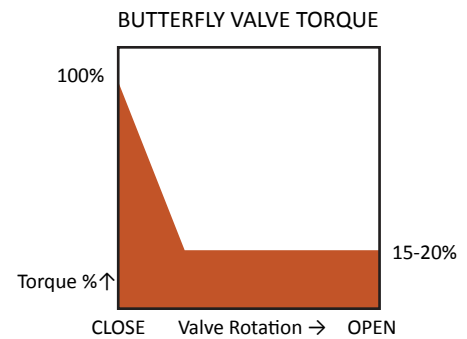

Ball Valve

Ball valve construction concept is based essentially on a polished ball (including a through port) contained in two seats (upstream and downstream). The ball rotation allows the flow, or stops the flow through the valve. Differential pressure between upstream and downstream pressure forces the ball against the downstream seat (floating ball). In this case, the valve torque is generated by the friction between ball and seat and also between stem and packing. As shown in the diagram to the right, the highest torque point is when, in presence of pressure, the valve is in the closed position, and passes to the open position (breakaway torque).

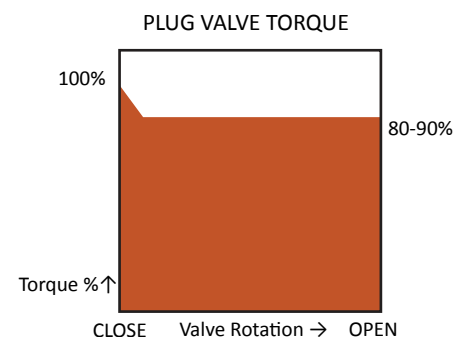

Butterfly Valve

Butterfly valve construction concept is based essentially on a disc fixed on an axis, which in the closed position, is completely contained by the seat. The open position is obtained when, with a rotation, the disc (through its stem) becomes parallel to the flow. On the contrary, the closed position is obtained when the disc is perpendicular to the flow. In the case of the butterfly valve, the torque is generated by the friction between the disc and the seat, by the stem packing and also by the differential pressure that forces on the disc. The highest torque point, as shown in the diagram, is in the closed position, and only after a small rotation it is considerably reduced.

Plug Valve

Plug valve construction concept is based essentially on a male (plug) contained in a female cone (seat). The plug provides a through port in one direction and with its rotation into the seat the opening and closure of the valve is obtained. The torque is usually not influenced by the flow pressure, but is generated essentially by the friction between the seat and the plug, during the opening closing cycle. As shown in the diagram to the right, the highest torque point is in the closed position and remains high for the rest of the operation, because the torque is not influenced by pressure.

	Kg	x	2.07	3.72	6.11	9.49	16.68
09	Lb	x	4.56	8.29	13.62	21.25	37.41
	Kg	x	2.07	3.76	6.18	9.64	16.97
10	Lb	x	4.63	8.38	13.78	21.56	38.03
	Kg	x	2.10	3.80	6.25	9.78	17.25

APPLICABLE TEMPERATURE & PRESSURE - Double Acting & Spring Return

OPERATING TEMPERATURE

BUNA	-20°C to 80°C	-4°F to 176°F
Viton	-20°C to 120°C	-4°F to 250°F
EPDM	-20°C to 80°C	-4°F to 176°F

PRESSURE RANGE

DA	20 - 120 PSI	1.5 - 8 Bar
SR	30 - 120 PSI	2.0 - 8 Bar

DOUBLE ACTING

SPRING RETURN

X40 - X90

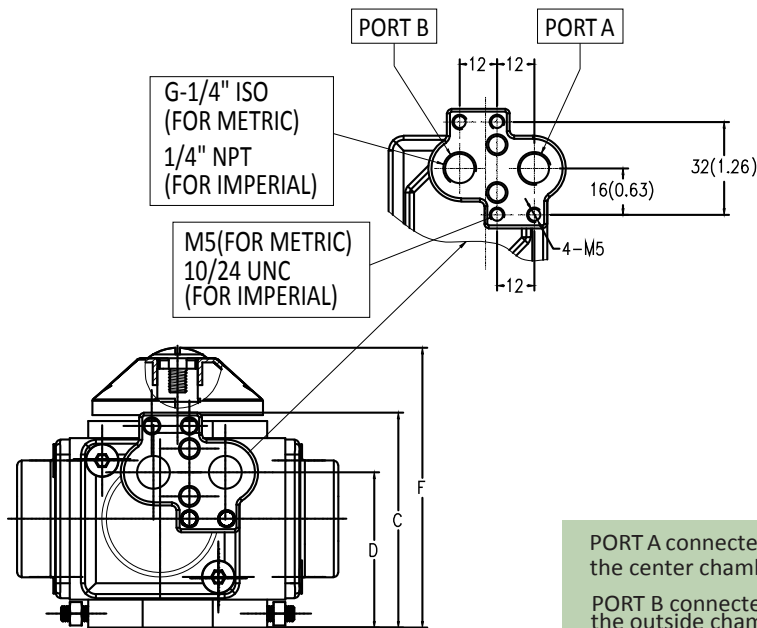

X115

X40 - X90

X115

PORT A connected to
 the center chambers
 PORT B connected to
 the outside chambers

Accessory Top Mount NAMUR Standard VDI/VDE 3845 Bottom Mount ISO 5211
